NOTIFICATION DATE

DELIVERY MODE

05/01/2009

ELECTRONIC

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

ldocket@crd.ge.com  
rosssr@crd.ge.com  
parkskl@crd.ge.com

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>	
	10/731,373	BALAN, CHELLAPPA	
	<b>Examiner</b>	<b>Art Unit</b>	
	KEITH WALKER	1795	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 09 April 2009.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1,2,4-10,13-17,19-35 and 42 is/are pending in the application.
- 4a) Of the above claim(s) 20-35 is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1,2,4-10,13-17,19 and 42 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 4/9/09 has been entered.

### ***Remarks***

Claims 1, 2, 4-10, 13-17, 19-35 & 42 are pending in the application with claims 20-35 withdrawn. Claims 1, 2, 4-10, 13-17, 19 & 42 are pending examination as discussed below.

### ***Claim Rejections - 35 USC § 102/103***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. Claims 1, 2, 4-9, 13, 15, 16, 19 & 42 are rejected under 35 U.S.C. 102(b) as being anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over US 5,380,600 (Hansen).

Hansen teaches a co-production system comprising a molten carbonate fuel cell and a separation unit configured to receive anode exhaust steam. The recycled anode exhaust stream goes through a shift reactor, a condenser and a hydrogen recovery unit before being fed back to the anode inlet stream. Natural gas is used for the fuel and air for the oxidant (Fig. 1; Abstract; 2:55-3:40). A heat exchange plate is used to receive and heat the fuel feed stream (Figs. 2 & 3). The system is configured to flexibly control the production of hydrogen and electricity that is on demand by altering the outlet reforming from adiabatic to no outlet reforming to isothermal (Tables 1-3).

Regarding claims 2, 4 & 5, these limitations are directed to the method of operating the fuel cell and intended use of the fuel cell and while considered, do not necessarily further limit the structure of the fuel cell. While intended use recitations and other types of functional language are not entirely disregarded, the intended use must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claim. Claims directed to apparatus must be distinguished from the prior art in terms of structure rather than function (MPEP 2114). The manner of operating the device does not differentiate an apparatus claim from the prior art. A claim containing a "recitation with respect to the manner in which a claimed apparatus is intended to be employed does

not differentiate the claimed apparatus from a prior art apparatus” if the prior art apparatus teaches all the structural limitations of the claim (MPEP 2114).

***Claim Rejections - 35 USC § 103***

2. Claims 1, 2, 3-10, 15, 17, 19 & 42 are rejected under 35 U.S.C. 103(a) as being unpatentable over US 5,084,362 (Farooque) in view of US 7,052,790 (Nakamura) and as evidenced by US Patent 3,522,101 (Baker).

With respect to claims 1, 9 & 10, Farooque teaches a fuel cell system for co-production of hydrogen and electricity comprising a molten carbonate fuel cell or solid oxide fuel cell assembly and an internal reforming apparatus that produces hydrogen fuel from hydrocarbon gas. The fuel cell system further comprises hydrogen separation and recovery device (8), which separates and recovers the unspent hydrogen in the anode exhaust, which comprises CO, CO<sub>2</sub>, steam and unspent fuel (1:43-56, 2:1-10, 2:54-61). Unspent hydrogen in the anode exhaust is recycled back to the anode inlet (Fig. 1).

Regarding claims 2, 4 & 5, these limitations are directed to the method of operating the fuel cell and intended use of the fuel cell and so while considered, do not necessarily further limit the structure of the fuel cell. While intended use recitations and other types of functional language are not entirely disregarded, the intended use must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claim. Claims

Art Unit: 1795

directed to apparatus must be distinguished from the prior art in terms of structure rather than function (MPEP 2114). The manner of operating the device does not differentiate an apparatus claim from the prior art. A claim containing a "recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus" if the prior art apparatus teaches all the structural limitations of the claim (MPEP 2114).

With respect to claim 2, it would be obvious to one skilled in the art at the time of the invention to operate the fuel cell in a low utilization manner so as to increase the amount of hydrogen in the exhaust so the hydrogen can supply fuel to other components of the system like a burner or gasifier, as taught by Farooque.

With respect to claim 4, it is well known in the art that molten carbonate fuel cell are operated at voltages ranging from 0.55 to 0.8 volts as evidenced by Baker (US 3,522,101), Example 2.

Regarding claim 5, Farooque is silent to the mole fraction of hydrogen at the anode outlet. However, Farooque discloses the hydrogen content in the exhaust stream can be manipulated by converting any CO in the stream to hydrogen (2:53-61).

Therefore, it would have been obvious to one of ordinary skill in the art to control the mole fraction of hydrogen in the anode exhaust between 0.1 and 0.5, because Farooque discloses converting the carbon monoxide in the exhaust stream can modify the amounts of hydrogen in the anode exhaust.

With respect to claim 6, Farooque teaches the oxidant is air.

With respect to claim 7, Farooque teaches the use of methane as the fuel (2:22-29).

With respect to claim 8, Farooque teaches the heat provided by the hydrogen for the gasifier (5) (2:42-53).

With respect to claim 15, Farooque teaches the fuel cell system comprising a shift converter and a hydrogen separation and recovery device (2:54-61).

Farooque is silent to the system comprising a water condenser for the anode exhaust and configuring the system to control production of hydrogen and electricity.

Nakamura teaches a fuel cell system comprising a cooling water, a cooling water pump, a heat exchanger, a fuel-side condenser and an oxidizer-side condenser that cool exhaust fuel gas and the exhaust oxidizer gas discharged from the fuel cell to condense content water vapor (Abstract; Fig. 1; 3:45-60, 6:15-20, 9:50-55). A controller is used to control the workings of the entire system (Figs. 2-13; 14:35-45).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to use add a condenser downstream of the fuel cell system of Farooque, because Nakamura teaches the use of the condenser to condense content water vapor in the exhaust which creates a more efficient system by recovering waste products. Also, it would have been obvious to one of ordinary skill in the art at the time of the invention to use the controller of Nakamura with the system of Farooque to control the entire system as required based on power needs. Farooque teaches the available hydrogen is dependent upon the fuel utilization. Nakamura teaches

Art Unit: 1795

configuring a system with a controller to control the fuel cell system to improve the efficiency of the system.

Regarding claim 17, Farooque incorporates by reference the teachings of US 4,620,914 (Abens) (2:62-65). Abens teaches the hydrogen separation device includes a membrane (Abens - 1:20-25).

3. Claims 13, 14 & 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over US 5,084,362 (Farooque) and US 7,052,790 (Nakamura) as applied to claims 1 & 15 above, and further in view of US 2004/0202914 (Sridhar).

The teachings of Farooque and Nakamura as discussed above are incorporated herein.

Farooque and Nakamura are silent to the system comprising a carbon dioxide separator.

Sridhar discloses a fuel cell system comprising a carbon dioxide separator (405) to separate the carbon dioxide before the anode exhaust is discharged to the ambient. An adsorption /absorption based separator is used (Fig. 9, paragraph 93).

Therefore, it would have been obvious to one of ordinary skill in the art to use add a carbon dioxide separator downstream of the fuel cell system of Farooque, because Sridhar teaches the use of the separator to separate the carbon dioxide before the anode exhaust is discharged to the ambient.

### ***Response to Arguments***

Applicant's arguments with respect to claim 1 have been considered but are moot in view of the new ground(s) of rejection.

Applicant's arguments filed 4/9/09 have been fully considered but they are not persuasive.

Applicant argues claims 2, 4 & 5 are not product-by-process claims but are hybrid claims to be given patentable effect. First, as discussed above, the claims were not interpreted as product-by-process claims but as methods of operating an apparatus. As such the method does not necessarily further limit the apparatus if the method does not further alter/limit the structural characteristics of the apparatus. Second, the claims were considered and limitations were not further limiting to the structure of the apparatus.

Applicant argues "the hydrogen from anode exhaust stream is reacted with coal to produce methane and thus hydrogen itself is not recycled to the anode inlet" and therefore Farooque doesn't meet the limitations of claim 1. Claim 1 recites, "a recycle stream in which at least a portion of the anode exhaust stream is recycled back to the anode inlet after separation of hydrogen..." This limitation is met by the teachings of Farooque. The claims do not prevent the recycled anode exhaust from going through other components before going back to the anode inlet. Applicant's arguments are not commensurate in scope with the claims.

Applicant argues since the gasifier produces methane and not hydrogen, the fuel sent to the inlet of the fuel cell is methane not hydrogen. Applicant's arguments are not commensurate in scope with the claims since this limitation is not positively recited in

the claims. As stated above, claim 1 requires, "a recycle stream in which at least a portion of the anode exhaust stream is recycled back to the anode inlet after separation of hydrogen..." This limitation is taught by Farooque and is not the same scope as argued by applicant.

Applicant argues the modification of Farooque to send the recycled hydrogen to the fuel cell instead of the gasifier would render Farooque inoperable. While this argument is moot since the alteration is not required to meet the claimed apparatus, Farooque clearly teaches that if a lack of hydrogen existed for the gasifier, additional hydrogen would be obtained from other sources (3:40-45). Therefore, the alteration would not render Farooque's apparatus inoperable.

Applicant alleges that Farooque only produces electricity and not hydrogen. However in the preceding paragraphs, applicant illustrates how Farooque teaches producing hydrogen to supply to the gasifier. So, it is unclear exactly what applicant is arguing when applicant illustrates that Farooque produces hydrogen for the system but then alleges that Farooque doesn't produce hydrogen and only produces electricity. As discussed above, Farooque teaches the production of both hydrogen and electricity as claimed and therefore meets the claimed invention.

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to KEITH WALKER whose telephone number is (571)272-3458. The examiner can normally be reached on Mon. - Fri. 8am - 5pm.

Art Unit: 1795

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick Ryan can be reached on 571-272-1292. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
